

Josh Heath

Linux Systems Administrator | Edge Infrastructure | Manufacturing IT

Gallatin, Tennessee • Open to onsite, hybrid, remote, relocation, and travel • Authorized to work in the U.S.

PROFESSIONAL SUMMARY

Linux systems and infrastructure professional with approximately eight years of enterprise IT experience and hands-on Linux use dating to 2004. Primary administrator of a 150+ device Raspberry Pi edge fleet supporting continuous manufacturing operations across multiple facilities. Experienced in Ansible administration, lifecycle-driven operating-system migrations, Linux imaging, network and peripheral troubleshooting, enterprise identity and endpoint services, staged deployment, and documentation-driven knowledge transfer. Combines production-floor experience with practical infrastructure ownership to deliver systems and instructions that remain supportable over time.

CORE SKILLS

Linux Administration: Raspberry Pi OS, Debian-based systems, systemd, cron, APT/dpkg, SSH and SSH keys, user administration, filesystems, partitioning, process and resource diagnostics

Networking & Peripherals: Static IP configuration, DNS/DHCP and socket troubleshooting, switch-port and cabling diagnostics, CUPS, lprng, raw queues, USB and printer diagnostics

Operations & Security: Rapid7 findings and remediation, firewall configuration, incident prioritization, vendor escalation, asset management, hardware imaging and deployment

Automation & Fleet Operations: Ansible server administration, inventories, playbooks, variables, golden images, staged pilots, rollback-image retention, Bash, Python, JSON

Enterprise Platforms: Microsoft Entra ID/Azure administration, Intune, Windows Autopilot, ERP account and print-queue support, ServiceNow, ServiceDesk Plus, Ivanti ServiceDesk and Neurons

Documentation & Support: Deterministic rebuild procedures, runbooks, knowledge-base articles, user training, peer-reviewed operator instructions, manufacturing and warehouse technology

PROFESSIONAL EXPERIENCE

TI Automotive | IT Technician

2018-Present

Linux infrastructure, edge systems, endpoint, identity, and manufacturing technology support

- Assumed primary operational ownership of a legacy Linux edge platform after its original developer departed, recovering system knowledge and establishing maintainable deployment and support practices.
- Administer a distributed fleet of 156 Raspberry Pi devices supporting MES access, label printing, operational dashboards, production displays, and warehouse terminals for approximately 200 users in continuous operations across two facilities.
- Designed and solely administer an Ansible environment supporting routine maintenance and disk-space monitoring across more than 100 production devices, including server administration, inventory, playbooks, variables, and access control.
- Performed lifecycle-driven, rebuild-based migrations through Raspberry Pi OS releases from Jessie through Trixie across Raspberry Pi 3B, 3B+, and 4B hardware, accounting for mixed versions and 32-bit versus 64-bit compatibility.
- Developed a controlled deployment process using overnight bench validation, a one-week production pilot, versioned rollback images, and 10-device rollout batches; completed normal device swaps and validation in less than 10 minutes without full-fleet outages.
- Replaced legacy NOOBS-based layouts with conventional images, recovering approximately half of installed storage on affected devices and reducing failures associated with constrained space, updates, print queues, and corruption.
- Migrated label printing from legacy Intermec/Honeywell PM43 and PX4i devices to approximately 150 PM45 printers; implemented raw CUPS queues and a shell utility that detected serial-specific USB device URIs and updated replacement-printer configuration.
- Installed fixed mounting assemblies across approximately 150 production stations, reducing recurring monitor falls and equipment damage to uncommon incidents while improving cable and peripheral reliability.
- Created approximately 10 rebuild, maintenance, diagnostic, and operator-support documents in Word, spreadsheets, and knowledge bases; validated instructions with operators, team leaders, and third-party support staff before final release.
- Administered Microsoft Entra ID/Azure and ERP user accounts, including creation, disablement, unlocks, password resets, and ERP print-queue control; supported Intune, Windows Autopilot, endpoint imaging, hardware repair, mobile devices, and enterprise ticketing platforms.
- Investigate network, switch-port, cabling, hardware, and peripheral faults; prioritize incidents, coordinate vendor escalation, remediate Rapid7 findings, maintain asset records, and train users in manufacturing and warehouse environments.

TI Automotive | Production, Quality & Team Leadership Roles

2016-2018

Operator • Quality Auditor • Team Leader

- Progressed through production operations, quality auditing, and team leadership before transitioning into IT.
- Applied direct production-floor experience to technical workflow design, user training, and concise instructions developed in collaboration with their intended operator and support audiences.

EDUCATION & PROFESSIONAL DEVELOPMENT

Volunteer State Community College | Cybersecurity coursework

RHCSA | Certification preparation in progress

Independent Linux Study | Ubuntu, Debian, and experimentation with Arch Linux, openSUSE, and Fedora/Red Hat
